Guided by: Dr Bilal Kanso

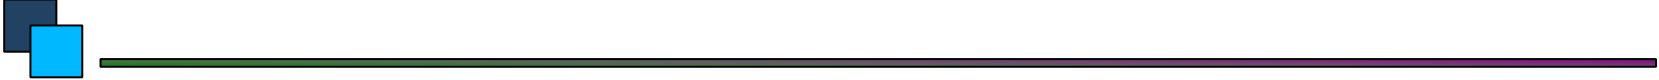

JobConnector

Introduction:

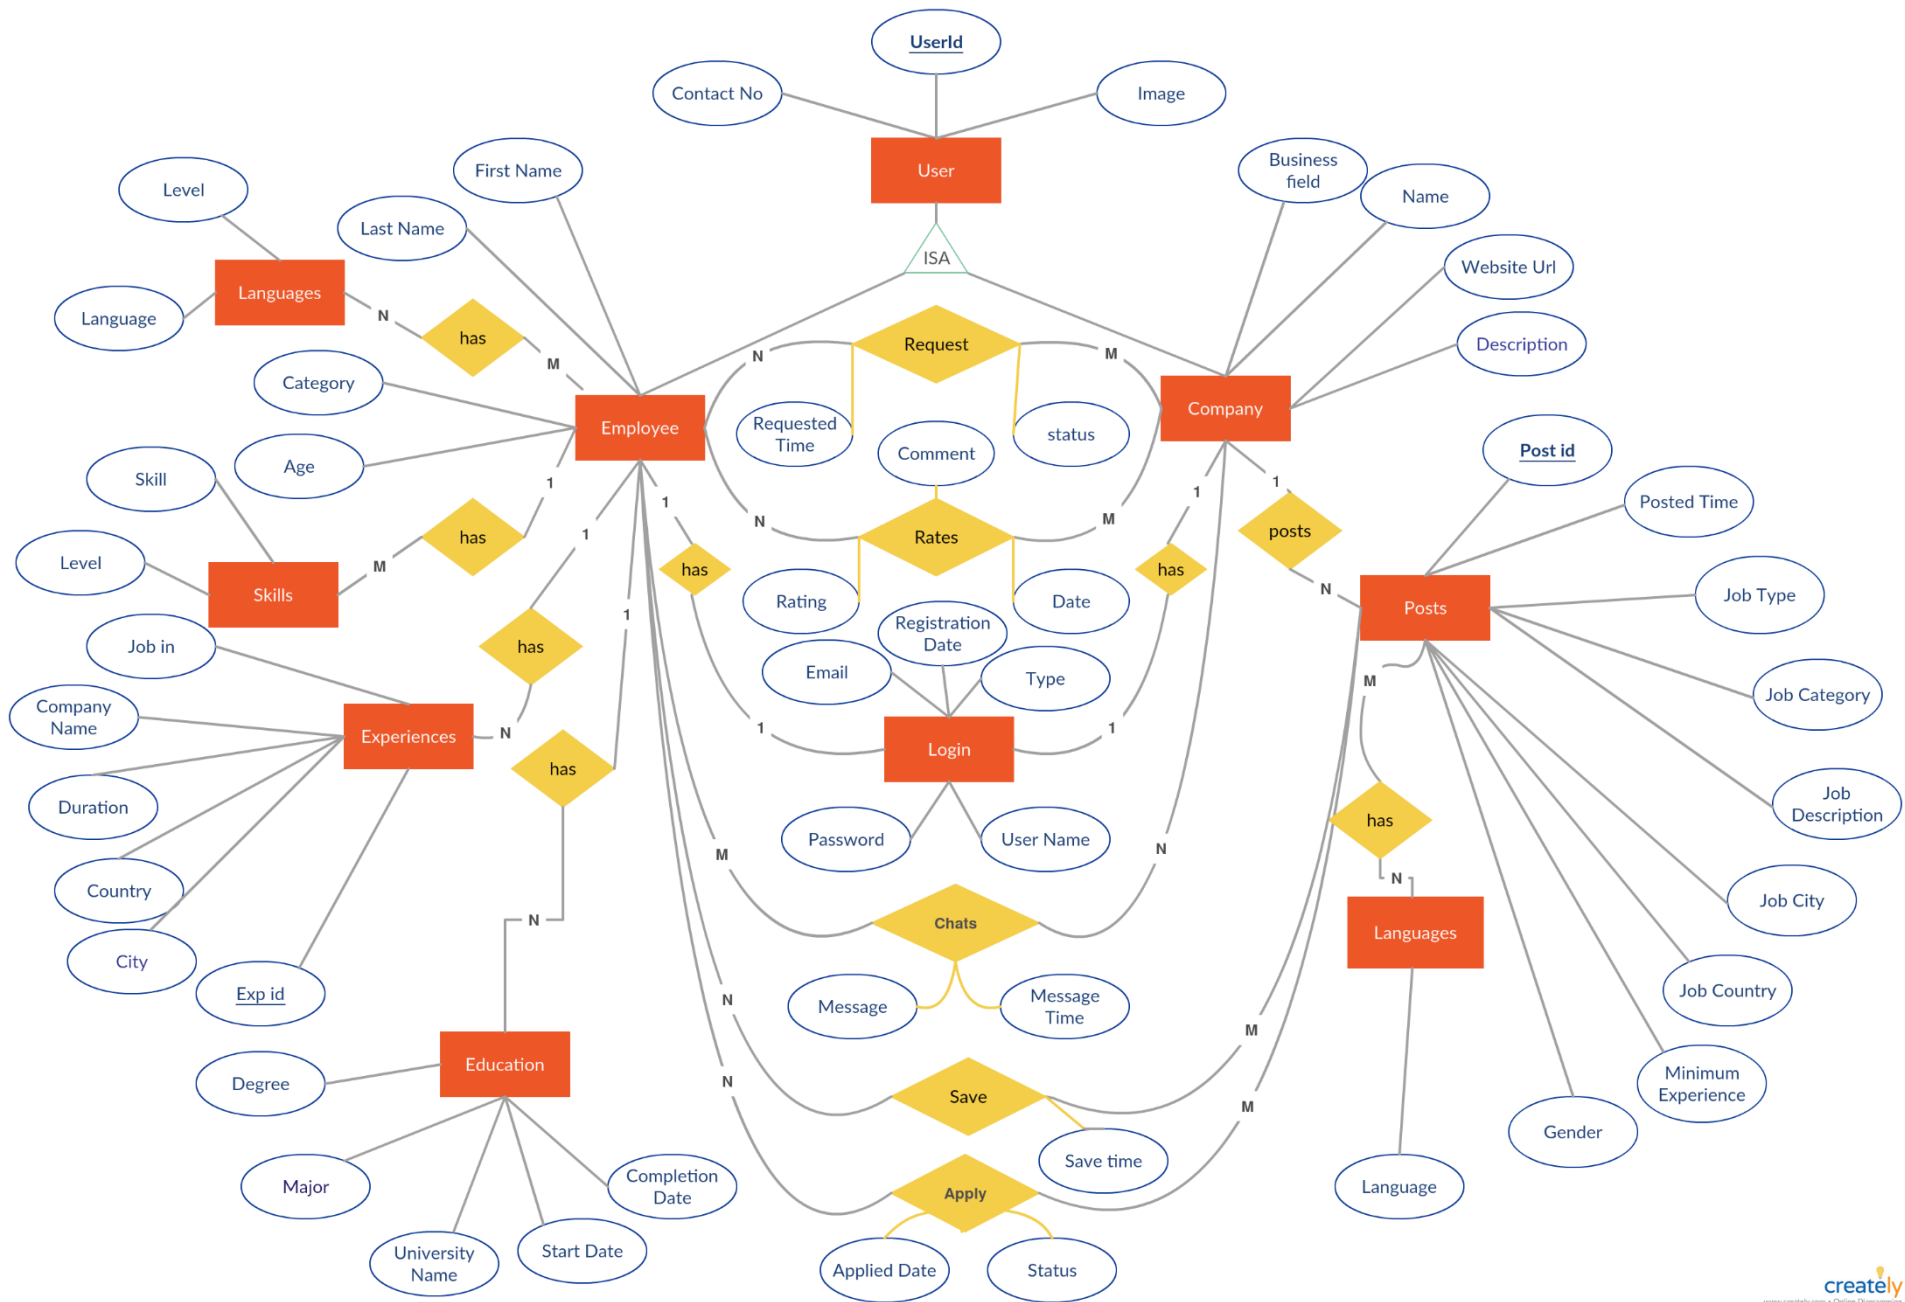

- The name of the project is JobConnector
- The application is for both jobseekers and recruiters as company.

Project OverView

The requirements are as follows :

- **Generic**
 - Login to the system through the first pages of the application.
 - See his / her profile details and change it.
 - Change email, username, and password.
 - Open Chats with each other.
 - Receive notifications.
- **Company**
 - Should be able to create new post.
 - Should be able to view number of applicant and status for each post .
 - Accept reject pending applicant.
 - Request and search employees.

- **Employee**
 - Should be able to view and search all jobs .
 - View details of the company.
 - View details of the job.
 - Apply to the job.
 - Accept reject a request.
 - Save and view saved posts .

- Now Video Recorders turn...

Conclusion

- The JobConnector application is an important tool for both jobseekers and recruiters.
- Most of the traditional methods are time consuming. The main purpose of the proposed project is to save the time of employee as well as the employers.
- The JobConnector system provides an easy to use menu where user can select different buttons according their needs.
- Find jobs & hire quality candidates for your company fast!

- With JobConnector,
 - ❑ you can job search and get notifications for work requests.
 - ❑ Find work fast and build your career in a single click.

Challenges

- We believe through this process and with challenges we faced, we have become two young developers that have learnt how to
 - ☐ Have an idea
 - ☐ Think about it
 - ☐ Research around the concept
 - ☐ Not to be afraid to confess about being wrong
 - ☐ Do what it takes to finish the job
 - ☐ Deliver well designed and developed app
- The last, but not least which can be even called our biggest challenge in this work has been the factor of time as both of us are working full time and studying beside it.

Future work

- **Set posts alarm**

Allow user to choose the companies he/she would like to keep updates with its all newly job posts.

This function saves all efforts on searching for companies posts.

- **Email Confirmation**

To authenticate the user, we plan to send a short message to the user's email upon registration. This prevents users from using fake email addresses.

Future work

- **Getting Offers**

For example : is user X actively looking for a job?

If so, they can be offered a product for creating an effective resume. Users who aren't actively looking for a job would not receive such an offer.

- **Uploading Resumes**

We'll allow employees the option of uploading their resume, where companies would be able search for employee with cv's and print their resumes and choose according to it.

- **Video Interview**

Companies and Employees would be able directly to make an interview with a click of a button.

*Thank
you*
